New transposon nucleic acid comprising a genetically engineered translation stop signal within a transposon end sequence recognized by a transposase useful for producing deletion derivatives of polypeptide. Claim 6; Page 30; Opp; English.

The invention relates to a transposon nucleic acid comprising a genetically engineered translation stop signal in the three reading frames at least partly within a transposon end sequence recognized by a transposase. The transposon is useful for producing deletion derivatives of polypeptide coding nucleic acids. The method involves performing a transposition reaction in the presence of a target nucleic acid containing a polypeptide coding nucleic acid and in the presence of a

transposon containing a genetically engineered translation stop signal sequence in three reading frames at least partly within a transposon end sequence recognized by a transposase, and recovering a target nucleic acid having the transposon incorporated in the protein coding nucleic acid. The present sequence represents a modified Cat-Mu(Stop)-transposon
                                                                                                                                                  9

Also described: (1) a pair of vectors (1) comprising: (a) a first vector. Also described: (1) a pair of vectors for the insertion of a gene, a gene encoding a first selectable marker, a double-stranded origin of replication and a site-specific recombination recognition site, where the gene is interposed between the double-stranded origin of replication of a rolling circle replicon and the site-specific recombination recognition site; and (b) a second vector comprising a negative selectable marker, a double-stranded and double-stranded origin of replication of a rolling circle replicon, a site-specific recombination recognition site and a gene encoding a second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene transfer; product vector; purification; detection; plasmid; pBC SK+;

```
selectable marker, where the gene encoding the negative selectable marker is interposed between the double-stranded origin of replication of a colling circle replication and the site-specific recognition site, where one or both of the vectors have no second site-specific recombinates as it e-specific recombinates as it e-specific recombination site, (2) a product vector comprising a gene, a double-stranded origin of replication of a rolling circle replication and a nucleic aid sequence encoding a second selectable replication and a nucleic aid sequence encoding a second selectable creplication and a nucleic aid sequence encoding a second selectable creplication of replication and the double-stranded origin of replication of a rolling circle replicon and the site-specific recombination site, and (3) a kit for the transfer of gene to crempination recognition site, and (3) a kit for the transfer of gene to a product vector comprising (1) and packaging materials. The method is useful in expressing mammalian cell and bacterial hosts, purification of the native protein by employing specialised purification tags and detection of interaction with other proteins. The present sequence represents the nucleotide sequence of plasmid pBC SK+, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2874
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2754
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2634

The present sequence is that of plasmid pRLS-CAT, a derivative of pcbmb 3X which has been modified to contain chloramphenicol resistance. The invention relates to the engineering of plasmids, of which pRL-CAT is a preferred example, for in aitu production of genes. It was found that nucleic acids encoding a polypeptide can be directly incorporated into a plasmid by DNA polymerisation or by reverse transcription of a nucleic acid template. Preferably, nucleic acids encoding at least a portion of an antibody can be directly incorporated into the plasmid by reverse transcription of mRNA. The plasmids are engineered to contain 2 template annealing sequences (see ABN84079-80 and ABN84082-83), i.e. a downstream primer that anneals to a first portion of a nucleic acid template, e.g. mRNA encoding at least a portion of an antibody, an upstream collar restriction site located between the 2 template annealing sequences. A sequence that anneals to a second portion of the template, and at least restriction site located between the 2 template annealing sequences. A single stranded DNA plasmid vector is produced containing a nucleic acid encoding at least a portion of a polypeptide, e.g. a light chain and/or a plasmid below that we be transformed into a host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprises two template annealing upstream collar sequence and a

The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, been designed to overcome certain drawbacks of the pcombix plasmid. These new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This polymucleotide sequence represents the plasmid pRL5-CAT nucleic acid

The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and B. coli. The new vectors have been designed to overcome certain drawbacks of the pComb3x plasmid. These new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This polynucleotide sequence represents the plasmid pRL5 bsi-CAT nucleic acid

replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and E. coli. The new vectors have been designed to overcome certain drawbacks of the pComb3X plasmid. These new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This polynucleotide sequence represents the plasmid pRL5 CAT-Asc nucleic acid sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     889

A composition containing (I) is useful in cleaning, bleaching and disinfecting applications such as paper and pulp bleaching, fabric and garment cleaning, hard surface cleaning and personal care applications (e.g. oral care, hair care, and skin care). (I) is useful in applications where peracid hydrolysis is useful, such as in the clean up of peracids. (I) enables effective cleaning, bleaching and disinfecting over broad pH and temperature ranges. The present sequence represents a M. smegmatis perhydrolase expression vector.

```
The invention relates to an adapter-directed display system for displaying an exogenous polypeptide on the outer surface of a genetic package, comprising an expression vector with esquence that encodes exogenous polypeptide fused to a first adapter sequence, and a helper vector with outer-surface sequences encoding proteins fused to a second adapter, the polypeptide is produced in a host cell to cause displaying a cut polypeptide. Also included are a helper vector for displaying a polypeptide on the outer surface of a genetic package (comprising, outer-polypeptide on the outer surface of a genetic package, where at least one of the surface presenting sequences is fused in-frame to adapter, the adapter acting, when the polypeptide is produced in a capters in outer surface of a genetic package (comprising a coding sequence encoding the outer surface of a genetic package (comprising a coding sequence encoding the polypeptide fused in-frame to a first adapter, where the vector is devoid of outer-surface sequences encoding any functional outer-surface proteins cof the genetic package, and expression of the polypeptide on the outer surface of the genetic package is mediated through non-covalent pairwise surface of the genetic package is mediated through non-covalent pairwise

The invention relates to a method for manufacturing 3-hydroxypropionaldehyde involving dehydrating glycerol with diol dehydratase and/or glycerol dehydratese and microbial cells comprising diol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor along a method for manufacturing 1,3-propanediol, a method for manufacturing 3-hydroxypropionic acid and methods for manufacturing acrolein, acrylic acid and acrylic ester. The dehydration reaction of glycerol is performed under aerobic conditions using microbial cells. This sequence represents plasmid Pl5a DNA used in the method of the invention.
                                                                                                                                Manufacture of 3-hydroxy propionaldehyde useful as raw mater
manufacturing 1,3-propanediol, by dehydrating glycerol with
dehydratase and/or glycerol dehydratase and microbial cells.
                                                                                                                                                                                      Example 1; SEQ ID NO 2; 40pp; Japanese

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4084
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   109
                                                                              hydroxypropionaldehyde involving dehydrating glycerol with diol dehydratase and/or glycerol dehydratase and microbial cells comprising diol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor and/or glycerol dehydratase reactivation factor. The invention also relates to a method for manufacturing 1,3-propanediol, a method for manufacturing 3-hydroxypropionic acid and methods for manufacturing acrolein, acrylic acid and acrylic ester. The dehydration reaction of glycerol is performed under aerobic conditions using microbial cells. This sequence represents plasmid Pl5a DNA used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    229
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      289
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        349
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          409
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            469
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           529

The invention relates to a recombinant nucleic acid molecule (1) acid bacterium, where (A) is codon-optimized for expression in the bacterium, where (A) is codon-optimized for expression in the bacterium, where (A) is codon-optimized for expression in the bacterium, and a second polymortal (B) encoding a polypeptide, where (B) is in the same translational reading frame as (A), where (A) encodes a fusion protein comprising the signal peptide and the polypeptide). Also comprising (I) and (B), a recombinant Listeria bacterium (II) comprising or treating a roadition in a host (comprising II), a method of preventing or treating a condition in a host (comprising II), a cecombinant Listeria bacterium (II), a cassette. The polypeptide encoded by (B) comprises an antigen (a tumor-associated antigen, an infectious disease antigen, or a polypeptide derived from an infectious disease antigen, or a polypeptide derived from an infectious disease antigen, or a polypeptide derived from an infectious disease antigen, or a polypeptide derived from an infectious disease antigen, or a polypeptide derived from an infectious disease antigen, or a polypeptide derived from an infectious disease antigen, or the bisteria bacterium, or both. The signal peptide from Listeria monocytogenes or is a p60 signal comprises human mesothelin deleted of its signal peptide and C(I) elsterial peptide and C(C) emplesses human mesothelin deleted of its signal peptide and companies the compinant bacterium is useful in the manufacture of a mantigen, and immune response in a host to an antigen, and animaniman in a host to an antigen is comprises human mesothelin deleted of its signal peptide and condition is a host to an antigen and animanimal mesothelin deleted of its signal peptide and condition is a host to an antigen or treating as useful in the manufacture of an encoded by the comprise and an immune response in a host to an antigen and antigen cancer, infections and autoimmunity. The recombinant nucleic acid molecule, expression casettes and vectors are useful for expressing and/or secreting polypeptides including heterologous polypeptides auch as antigens in bacteria. The present sequence represents the Vector pAM401 which contains the hly promoter/p60 signal peptide cassette. New recombinant nucleic acid molecule (comprising a first polynucleotide encoding a signal peptide native to a bacterium; and a second polynucleotide encoding a polypeptide) useful e.g. to induce immune response in host to antigen. The invention relates to a recombinant nucleic acid molecule (I) Vector; ds; listeriolysin O; Cytostatic; Antimicrobial; Immunosuppressive; Immunostimulant; vaccine; fusion protein; protein production; protein secretion; immune response; cancer; infection; autoimmune disease. Eliciting an immune response comprises administering to an individual a composition comprising an Eph2 antigenic peptide, an Eph2 antigenic peptide expression vehicle, or antigen presenting cells.

Disclosure, SEQ ID NO 43; 241pp; English.

The invention relates to a method of eliciting an immune response against an Eph2-expressing cell. The method comprises administering to an individual a composition comprising an Eph2 antigenic peptide, an Eph2 antigenic peptide expression vehicle, antigen presenting cells sensitized with an EphA2 antigenic peptide, or an anti-idiotypic antipody or its antigen-binding fragment, which immunospecifically binds to an idiotype of an anti-EphA2 antibody, in an amount to elicit an immune response against an EphA2-expressing cell. Also described are: (1) a method of treating a human individual having a hyperproliferative disorder of an EphA2-expressing cell, or a disease involving aberrant angiogenesis, comprising performing the method of the invention; and (2) a method of administering them to an individual as an EphA2 vaccine. In the method of

The invention, the kppak antiguing peptide is not any of the sequences given as SEQ in the specification. The composition further comprises an adjuvant, a heat shock protein bound to the Bph2 antigenic peptides. The expression vehicles expressing the Bph2 antigenic peptides. The expression vehicles expressing the Bph2 antigenic peptides. The expression vehicle is an infectious agence encoding the Bph2 antigenic peptide operably linked to a promoter, where the sequence antigenic peptide operably linked to a promoter, where the sequence conditions the infectious agent. The method of the invention is useful for treating a human individual having a hyperproliferative disorder of Bph2.

The expressing cells by administering to the individual a composition comprising antibodies produced by administering an Bph42 vaccine to a composition comprising an Bph42 expression cells. Alternatively, the individual can be administered with a composition comprising an Bph42 expression vehicle, e.g. bacterium or virus, in an amount to treat a hyperproliferative disorder of Bph42.

Expressing cells, and administering to the individual an antibiotic or antiviral agent in an amount to treat a bacterial or viral infection. The methods and compositions of the invention are useful for eliciting an immune response against an BphA2-expressing cell, and for treating a contract of the skin, the contract of renal cell carcinoma or melanoma), a non-neoplastic hyperproliferative disorder (e.g. an epithelial cell disorder, specifically asthma, chronic pulmonary obstructive disease, lung fibrosis, bronchial hyper responsiveness, psoriasis, or seborrheic dermatitis), or a disease involving aberrant anglogenesis (e.g. macular degeneration, diabetic retinopathy, retinopathy of prematurity, vascular restenosis, infantile hemangioma, verruca vulgaris, Kaposi's sarcoma, neurofibromatosis, recessive dystrophic epidermolyysis bulloas, rheumatoid arthritis, ankylosing spondylitis, systemic lupus, psoriatic arthropathy, Reiter's syndrome, and Sjogren's syndrome, endometriosis, preeclampsia, atheroscierosis or coronary artery disease). This sequence represents a plasmid containing a multiple cloning site (MCS). It is used in the exemplification of the method of the invention. lung, colon, ovary, esophagus, breast, prostate, bladder or pancreas or invention, the EphA2 antigenic peptide is NOT any of the sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of the plasmid pRZTL1 which is used to demonstrate in vitro transposition of a transposable element located between a pair of Tn5 (transposen 5) outside end (OB) termini. The invention provides a genetic construct that contains a nucleotide sequence encoding a modified Tn5 transposase enzyme that has both greater avidity for Tn5 OB repeats and is less likely to assume an inactive multimeric form than a wild type Tn5 transposase and a transposable DNA sequence flanked at its 5' and 3' ends by an 18 or 19 base pair flanking DNA sequence comprising nucleotide A at position 10, T at 11 and A at 12. DNA sequence comprising nucleotide A at position 10, T at 11 and A at 12. The modified Tn5 transposase and the transposable DNA which is a DNA chonce molecule are used in a system for in vitro transposation. The system and method can be used to create absolute defective mutants, to provide selective markers to target DNA, to provide portable regions of homology to a target DNA, to facilitate insertion of specialised DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences into target DNA, to provide primer binding sites or tags for DNA sequences into ther desired combinations of DNA sequences (combinatorial content easired combinations of DNA sequences (combinatorial content easired combinations of at least about 100-fold higher than tanker because the transposase facilitates in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2212
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2092
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modified Tn5 transposase construct used in novel system for in vitro transposition - used to, e.g. create absolute defective mutants, provide selective markers and to facilitate insertion of specialised DNA sequences into target DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            be achieved using wild type transposase (as measure in vivo). In vitto transposition using this system can also use donor DNA and target {\sf DNA} that is circular or linear. The system also requires no outside high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          source and no other protein other than the modified transposase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2093 GGCATTIGAGAAGCACACGGTCACACTGCTTCCGGTAGTCAATAAACCGGTAAACCAGGA

The insertion of the Th5 transposase releases a fragment of the plasmid that corresponds to the region of Kanamycin resistance gene that lies between the two OB sequences. The plasmid was also used to investigate the nature of the termini involved in the transposition reaction. Wildtype Outside End (OB,AA206435) and Inside End (IE, AA206439) were compared and an effort made to randomise the nucleotides at each of the seven positions of difference. This eventually lead to the identification of the mutant OB sequences AA206435 and
